

The oxygen concentrator is not only for the sick, but also for the healthy!

- The oxygen concentrator is a medical device. It is based on a compressor and a zeolite granular filter that removes nitrogen from the air, removes oxygen in high concentrations through an oxygen supply mask, which is removed from the air before it is cleaned of dust and dirt. Atmospheric air contains 79% nitrogen and 21% air. For people who do not have enough oxygen in the body as a result of a viral infection or chronic lung disease, the purchase of such a device provides continuous oxygen therapy in private and at home. At a concentration of 90-97% oxygen is delivered through a face mask or breathing cannula. Breathe life with Solano oxygen concentrators!

- Oxygen concentrator supplies the body with oxygen in a concentrated form. If the body is weakened as a result of a virus or lung disease, such a device is a convenient solution for a smooth recovery. In addition, the modern design and compactness of the device do not interfere with mobility. You may feel better when you go about your daily activities or recover from an illness. How one breathes - he lives. Choose a fulfilling life!

- People experience a lack of oxygen every day, even if they are healthy. It causes drowsiness, stress and irritability, contributes to various diseases, causes headaches and disorders. Oxygen deficiency is felt throughout the body, the risk of infection with surrounding viruses increases, and oxygen deficiency contributes to the development of pre-existing chronic diseases. Oxygen therapy improves the functionality of the whole body. Oxygen improves respiratory function, enriches tissues with oxygen, and the body's energy is significantly increased. How you breathe - you will live!

- The oxygen concentrator is based on a filter and a compressor that filters nitrogen. Atmospheric air is composed of 21% oxygen and 79% nitrogen. The Oxygen Concentrator is a mobile device the size of a carry-on suitcase and delivers an O₂ concentration of 95–99%. Such oxygen breathing promotes recovery in case of illness, improves the quality of life, and increases energy. Breathe!

- A daily sedentary lifestyle may not be enough for a person to be sufficiently oxygenated in their body tissues. We offer a type of oxygen therapy - oxygen inhalation. It is a medical procedure that can now be performed at home. Inhaling oxygen through a face mask provides a higher oxygen concentration during inhalation than in the atmosphere. Breathe in energy, joy of life and health!

- For the normal functioning of the body, there must be 20-21% oxygen in the air. In autumn and winter, we mostly stay indoors, where the oxygen concentration can drop to 16-17%. This is not enough for proper breathing. It affects the metabolic functions of the body. A person becomes apathetic, slow, frustrated, tired, and stress contributes to body burnout.

Breathing is one of the most important processes affecting the physiological functions of the body. Without sufficient oxygen, it is impossible to sow cellular metabolism and energy production. Breathe high-quality oxygen - be healthy, full of energy, be able to work and get the best from life, using the equipment for the production of oxygen - Oxano Concentrator Solano Lumio.

- Breathing provides oxygen supply to the body and removal of carbon dioxide, further transport of oxygen to cells and its use in cells. Oxygen releases energy in cells as each cell breathes. Oxygen gives energy. There is oxygen in the air. For a person to feel good, the oxygen concentration in the air must be at least 20%. Colorless, tasteless and odorless. Oxygen does not burn and is poorly soluble in water. Breathing exercises are recommended to increase the amount of oxygen in the body. We offer the most advanced equipment that allows you to concentrate oxygen uptake, increasing efficiency, joy of life, objective general health and stability.

- How to increase the amount of oxygen in the body - blood and brain? Correct breathing. When breathing through the mouth out of habit or limited health, a person does not receive enough oxygen. The blood circulation in the brain is blocked, and the brain cells do not receive the required amount of oxygen. Correct breathing is diaphragmatic breathing. However, in case of deteriorating health, this is not the best time to learn breathing exercises. This is why we offer a solution. The most common form of oxygen production in the world is through the use of oxygen concentrators. This means a concentrated supply of oxygen at a specific time. We suggest using our concentrators to restore health, prolong life, and restore the body. More information at www.solano-labs.com
